Abstract

Mathematics and Computer Science are deeply intertwined; some universities even offer CS *as* a math course. However,

1 Motivations

Computer Science is arguably one of the most interesting fields of **math**, so why is there such a big disconnect between the math one learns in university and high school CS and the programming language of choice?

Take the example of a simple sum function in math:

$$f(a, b) = \sum_b^a b, \{a, b\} \in \mathbb{N}$$

This is an example of Sigma notation, a much-used concept in many parts of math. Taking a look at the equivalent expression in Python,

```
def sum_loop (top_bound, start):  
    accumulator = 0  
    for i in range(start, top_bound+1):  
        accumulator += i  
        i+=1  
    return accumulator
```

One might see that the two have absolutely nothing in common.

This may not seem like a problem; the programmer just needs to learn programmatical intuition. However,
